Fodder

From Wikipedia, the free encyclopedia

In <u>agriculture</u>, **fodder** or **animal feed** is any <u>foodstuff</u> that is used specifically to feed <u>livestock</u>, such as <u>cattle</u>, <u>sheep</u>, <u>chickens</u> and <u>pigs</u>. Most animal feed is from plants but some fodder is of animal origin.

Common plants specifically grown for fodder

- grass (as grazing pasture and for cropping and storage as hay and silage)
 - o <u>ryegrass</u>
 - o bermuda grass
 - o <u>timothy-grass</u>
 - o <u>danthonia</u>
- wheat
- <u>millet</u>
- soybean

Round hay bales

- oats
- <u>alfalfa</u> (lucerne)
- sorghum
- <u>clover</u>
 - o <u>red clover</u>
 - o white clover
 - o <u>subterranium clover</u>
- <u>maize</u> (corn)
- brassicas
 - o chau moellier
 - o <u>kale</u>
 - o rapeseed (Canola)
 - o <u>rutabaga</u> (swede)
 - o <u>turnip</u>
- birdsfoot trefoil

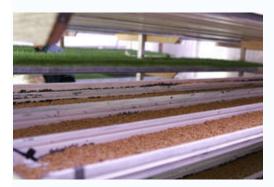

Types of fodder

- <u>hay</u>, <u>silage</u>, <u>stover</u> and <u>straw</u>
- oil cake and press cake
- yeast extract and oligosaccharides

Health concerns

<u>Meat and bone meal</u>, a common feed ingredient, can cause <u>mad cow disease</u> in <u>beef</u> due to <u>prion</u> contamination. Consumers can avoid this risk by buying <u>grass fed beef</u>.

Growing Fodder Hydroponically

Fodder factory set up by a farmer for his 100 head of cattle

Fodder may be effectively grown in a <u>hydroponic</u> environment. Growing fodder, instead of feeding the "raw" grain to stock, can greatly increase the value of the grain. For instance, 1 <u>ton</u> of barley can be converted to 7 tons of fodder in less than two weeks.
